GAME DESIGN PORTFOLIO

Celine

Systems · Narrative · Playable Prototypes

I design gameplay systems and narrative experiences, using playable prototypes and player feedback to guide iteration.

Tyrant's Court

Solo Designer · Unity 6 · 2026.02–2026.04

Key art for Tyrant's Court. The word KING belongs to this project.

Title screen of the playable build. It is the entry UI, not an Evidence decision during a round.

CONCEPT

A card prototype about information, exposure, and shared risk. In the current version, holding Evidence is the advantage, and that same Evidence becomes vulnerability once it is exposed.

MY CONTRIBUTION

I designed the game and its systems, then revised them from what players did in playtests.

DESIGN FOCUS

Direct attacks crowded the earlier version. The current rules remove them. Players still affect one another because one player's Evidence changes the shared round-end punishment. The refined notes do not restate a separate win condition.

AI use: generated visual assets and code.

IN DEVELOPMENT

Wonder Tales

Solo design and paper prototype · Playable paper prototype · Digital version not implemented

Diagram of the designed paper loop. This is not a photograph of a test.

01	02	03	04	05
Scene	Chosen action	Dice, 1–100	Facilitator result	Handwritten note

Card gallery art. It is not a photograph of the paper prototype, and the cover on page 1 is a concept cover, not a shipped digital game.

CONCEPT

Wonder Tales asks whether investigation, choices, and cards can carry Chinese folk horror. I host the paper session. No computer resolves actions or runs a build.

MY CONTRIBUTION

I independently designed the game and the facilitated paper prototype, and I ran the paper sessions.

DESIGN FOCUS

The first session needed too much folklore explained, split attention across the group, and left self-made characters outside the story. The revision moves toward a defined outsider investigator and a tighter sequence. That is the next question, not a measured result.

PLAYABLE DEMO

One Inch Away

Associate Director and Gameplay Developer · 7 people · 42 hours

Co-op level from the team build. Both characters are in the space, separated by the platforms.

Another level from the same build, with the two characters in separate vertical routes.

CONCEPT

A cooperative platformer. Two magnets of the same polarity can never touch, so one player's position pushes the other through the level.

MY CONTRIBUTION

I implemented movement, magnetic repulsion, level interaction, and tuning, and I took part in the shared direction of the jam.

DESIGN FOCUS

The push is always active, so movement is a negotiation. Standing closer increases that push and changes where the other player can land. The case study does not record a numeric force value from the tuning.

Solo Developer · Unity · 2026

A post in the queue, with four action buttons. The case study names the actions Promote, Send, Limit, and Ban.

The same kind of screen after an action. It labels the two metrics Security 57 and Happiness 66.

CONCEPT

A moderation prototype. Each post offers four actions, and the choice moves community happiness and information safety in different directions.

MY CONTRIBUTION

I designed and built the actions, the two metrics, and the selection of which material appears. The post text is not all my original writing.

DESIGN FOCUS

For the example “Suspicious link detected...”, Promote changes happiness by 10 and safety by −20. Limit changes happiness by −5 and safety by 15. Send and Ban are in the prototype; this example does not assign numbers to them. No playtest revision is recorded.
